Abstract

In theoretical computer science, conferences play an important role in the scientific process. The decisions whether to accept or reject articles is taken by the program committee (PC) members. Serving on a PC for the first time can be a daunting experience. This guide will help new program-committee members to understand how the system works, and provide useful tips and guidelines. It discusses every phase of the paper-selection process, and the tasks associated to it.

Introduction and Overview

Scientific method and the role of conferences

One of the core principles of modern scientific research is *peer review*. New research results are written up as articles and submitted to journals or conferences where they are reviewed by (usually multiple anonymous) experts in the field. These experts judge whether the article fulfills the scientific standards and fits the publication venue. Only after an article has passed this quality check by peers, it is considered *published* and becomes part of the scientific literature.

Publication cultures differ vastly between different research fields. In computer science, it is common that research articles are first submitted to conferences, and only a subset of those articles are worked out to "full versions" and later submitted to journals. In sharp contrast, the standard practice in mathematics and physics is to submit new research articles directly to journals.

These differences in publication cultures lead to a very different understanding and experience of the role conferences play in this process. In computer science, conferences and their published proceedings are the main venues for publication and therefore very important. Researchers have quite a clear picture in their head about the "ranking" or "tier" of all conferences they submit to. The more prestigious conferences in theoretical computer science (TCS) like FOCS and STOC tend to receive hundreds of submissions, and have acceptance rates of around 30%, and the best conferences specialized in a particular subfield tend to have even lower acceptance rates. It is important for the career of junior researchers (PhD students and postdocs) in TCS to have articles published at good conferences, and the task of giving a conference presentation is often offered to these junior researchers in order to give them the opportunity to make their first contacts with the research community.
