Abstract

Unitary dynamics with a strict causal cone (or "light cone") have been studied extensively, under the name of quantum cellular automata (QCAs). In particular, QCAs in one dimension have been completely classified by an index theory. Physical systems often exhibit only approximate causal cones; Hamiltonian evolutions on the lattice satisfy Lieb-Robinson bounds rather than strict locality. This motivates us to study approximately locality preserving unitaries (ALPUs). We show that the index theory is robust and completely extends to one-dimensional ALPUs. As a consequence, we achieve a converse to the Lieb-Robinson bounds: any ALPU of index zero can be exactly generated by some time-dependent, quasi-local Hamiltonian in constant time. For the special case of finite chains with open boundaries, any unitary satisfying the Lieb-Robinson bound may be generated by such a Hamiltonian. We also discuss some results on the stability of operator algebras which may be of independent interest.

Contents

1 Introduction **2**
1.1 Prior work . . . 3
1.2 Summary of results . . . 4

2 Operator algebras **7**
2.1 C^*-algebras . . . 7
2.2 Von Neumann algebras . . . 8
2.3 Near inclusions and stability properties . . . 9

3 Dynamics on spin systems **13**
3.1 The quasi-local algebra . . . 13
3.2 QCAs and approximately locality-preserving unitaries . . . 15

4 Index theory of one-dimensional QCAs revisited **22**
4.1 The structure of one-dimensional QCAs and the GNVW index . . . 22
4.2 An entropic definition of the GNVW index . . . 26
4.3 Robustness of the GNVW index . . . 29
